

## So how is your neighborhood doing?

- Is there a mix of species and ages, developing at different paces and interacting in ways that will continue to provide benefits decades from now?
- Is tree planting continuing, or is there just a cohort of older trees aging and, perhaps, declining?
- Have the hazards been identified and the risks evaluated?
- Have the older trees of value for history and size been identified and protected?
- Do you have a replacement plan? Trees have life spans, new pests and diseases can affect certain species.
- If your neighborhood is solar, do you have a tree planting plan for the open common areas where larger trees could be planted to compensate for the restrictions caused by solar access needs?
